

# PHP MySQL CRUD Application

In this tutorial you'll learn how to build a CRUD application with PHP and MySQL.

## What is CRUD

CRUD is an acronym for **C**reate, **R**ead, **U**ppdate, and **D**eleate. CRUD operations are basic data manipulation for database. We've already learned how to perform create (i.e. insert), read (i.e. select), update and delete operations in previous chapters. In this tutorial we'll create a simple PHP application to perform all these operations on a MySQL database table at one place.

Well, let's start by creating the table which we'll use in all of our example.

## Creating the Database Table

Execute the following SQL query to create a table named *employees* inside your MySQL database. We will use this table for all of our future operations.

Example	Download
<pre>CREATE TABLE employees (     id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,     name VARCHAR(100) NOT NULL,     address VARCHAR(255) NOT NULL,     salary INT(10) NOT NULL );</pre>	

## Creating the Config File

After creating the table, we need create a PHP script in order to connect to the MySQL database server. Let's create a file named "config.php" and put the following code inside it.

We'll later include this config file in other pages using the PHP `require_once()` function.

Example	Procedural	Object Oriented	PDO		Download
<pre>&lt;?php /* Database credentials. Assuming you are running MySQL server with default setting (user 'root' with no password) */ define('DB_SERVER', 'localhost'); define('DB_USERNAME', 'root');</pre>					

```
define('DB_PASSWORD', '');
define('DB_NAME', 'demo');

/* Attempt to connect to MySQL database */
$link = mysqli_connect(DB_SERVER, DB_USERNAME, DB_PASSWORD, DB_NAME);
```

If you've downloaded the Object Oriented or PDO code examples using the download button, please remove the text "-oo-format" or "-pdo-format" from file names before testing the code.

**Note:** Replace the credentials according to your MySQL server setting before testing this code, for example, replace the database name 'demo' with your own database name, replace username 'root' with your own database username, specify database password if there's any.

## Creating the Landing Page

First we will create a landing page for our CRUD application that contains a data grid showing the records from the *employees* database table. It also has action icons for each record displayed in the grid, that you may choose to view its details, update it, or delete it.

We'll also add a create button on the top of the data grid that can be used for creating new records in the *employees* table. Create a file named "index.php" and put the following code in it:

Example

Procedural

Object Oriented

PDO

Download

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>Dashboard</title>
  <link rel="stylesheet"
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.css"
  >
  <script
src="https://ajax.googleapis.com/ajax/libs/jquery/1.12.4/jquery.min.js">
</script>
```

Once *employees* table is populated with some records the landing page i.e. the CRUD data grid may look something like the picture shown below:

# Employees Details

[Add New Employee](#)

#	Name	Address	Salary	Action
1	Roland Mendel	C/ Araquil, 67, Madrid	5000	  
2	Victoria Ashworth	35 King George, London	6500	  
3	Martin Blank	25, Rue Lauriston, Paris	8000	  

**Tip:** We've used the Bootstrap framework to make this CRUD application layout quickly and beautifully. Bootstrap is the most popular and powerful front-end framework for faster and easier responsive web development. Please, checkout the [Bootstrap tutorial](#) section to learn more about this framework.

## Creating the Create Page

In this section we'll build the **Create** functionality of our CRUD application.

Let's create a file named "create.php" and put the following code inside it. It will generate a web form that can be used to insert records in the *employees* table.

Example

Procedural

Object Oriented

PDO

Download

```
<?php
// Include config file
require_once "config.php";

// Define variables and initialize with empty values
$name = $address = $salary = "";
$name_err = $address_err = $salary_err = "";

// Processing form data when form is submitted
if($_SERVER["REQUEST_METHOD"] == "POST"){
    // Validate name
    $name = trim($_POST["name"]);
    if(empty($name) || strlen($name) > 50){
        $name_err = "Please enter a valid name";
    }
}
```

The same "create.php" file will display the HTML form and process the submitted form data. It will also perform basic validation on user inputs (*line no-11 to 37*) before saving the data.

## Creating the Read Page

Now it's time to build the **Read** functionality of our CRUD application.

Let's create a file named "read.php" and put the following code inside it. It will simply retrieve the records from the *employees* table based the id attribute of the employee.

Example	Procedural	Object Oriented	PDO	Download
<pre>&lt;?php // Check existence of id parameter before processing further if(isset(\$_GET["id"]) &amp;&amp; !empty(trim(\$_GET["id"]))) {     // Include config file     require_once "config.php";      // Prepare a select statement     \$sql = "SELECT * FROM employees WHERE id = ?";      if(\$stmt = mysqli_prepare(\$link, \$sql)) {         // Bind variables to the prepared statement as parameters         \$stmt-&gt;bind_param("i", \$param1);</pre>				

## Creating the Update Page

Similarly, we can build the **Update** functionality of our CRUD application.

Let's create a file named "update.php" and put the following code inside it. It will update the existing records in the *employees* table based the id attribute of the employee.

Example	Procedural	Object Oriented	PDO	Download
<pre>&lt;?php // Include config file require_once "config.php";  // Define variables and initialize with empty values \$name = \$address = \$salary = ""; \$name_err = \$address_err = \$salary_err = "";  // Processing form data when form is submitted if(isset(\$_POST["id"]) &amp;&amp; !empty(\$_POST["id"])) {     // Get hidden input value     \$id = \$_POST["id"];</pre>				

## Creating the Delete Page

Finally, we will build the **Delete** functionality of our CRUD application.

Let's create a file named "delete.php" and put the following code inside it. It will delete the existing records from the *employees* table based the id attribute of the employee.

Example	Procedural	Object Oriented	PDO		Download
---------	------------	-----------------	-----	---	----------

```
<?php
// Process delete operation after confirmation
if(isset($_POST["id"]) && !empty($_POST["id"])){
    // Include config file
    require_once "config.php";

    // Prepare a delete statement
    $sql = "DELETE FROM employees WHERE id = ?";

    if($stmt = mysqli_prepare($link, $sql)){
        // Bind variables to the prepared statement as parameters
        $stmt->bind_param("i", $id);
```

## Creating the Error Page

At the end, let's create one more file "error.php". This page will be displayed if request is invalid i.e. if id parameter is missing from the URL query string or it is not valid.

Example		Download
---------	---	----------

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <title>Error</title>
    <link rel="stylesheet"
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.css"

    <style type="text/css">
        .wrapper{
            width: 750px;
```

After a long journey finally we've finished our CRUD application with PHP and MySQL. We recommend you to check out [PHP & MySQL database](#) tutorial section from the beginning, if you haven't already covered, for a better understanding of each and every part of this tutorial.
